proposed structure of the new SWL telescope at the Observatorio del Teide in Tenerife. Credit: ESO/C. Cappellini ESO and the European Southern Observatory (ESO) have concluded the design phase for a new large optical-infrared space telescope, the Square Kilometre Array (SKA) pathfinder telescope. During the second and final 10-day session of the “Multi-Element Large-Aperture Giga-Hertz Radio-Astronomy in Europe” workshop in Madrid, Spanish engineers unveiled the plans for the new space

telescope and the process to build and operate it. The SKA project, initiated in 2011, seeks to build an ultra-sensitive radio telescope about the size of a suburban home and the sensitivity of a radio telescope 50 times larger than the current largest telescope. The new telescope will incorporate thousands of separate electronic beam detectors which will record the radio waves. The new telescope will also incorporate what will be the first completely new, flexible, and accurate space-based gravity-

mapping mission, in the Constellation Program (Constellation Mission), which will map a third of the entire Milky Way. In addition to making the first complete gravity map of our Galaxy, the results will be of value in a wide range of other fields, including cosmology, planet formation, and astrophysics. The Constellation Mission will also contain a third scientific instrument, which will examine the light emitted by black holes. ESO, in collaboration with the SKA

pathfinder scientists, is studying how the technology can be optimized to meet their mission requirements, and one possible approach is to use a single large aperture but to spread out the antennas, detectors, and electronics over a large number of small-aperture telescopes. This “SWL” (single-wide-long) telescope structure could be developed relatively quickly, requiring comparatively f678ea9f9e
